MATCHING CIRCUIT AND REFERENCE VALUES

Chip antenna should be matched with the environment of final products. Normally this process can be done with capacitor or inductor.

Passive Test with Network Analyzer

Range of Matching Component Values

Component	Description	Value
Antenna	AMCA31-101-2R450G-S1F-T3	----
Capacitor	*Series C	0.5 ~ 10 pF
	*Shunt C	33pF, 100 pF
Inductor	Series L	1.0 ~ 6nH
	Shunt L	1.0 ~ 6nH

*Series: Connected between antenna and feeding line in series.

*Shunt: Connected between antenna and feeding line in parallel

Note: Recommendation is to pre-place the π -type circuit layout circuit which will offer full flexibility to match the antenna to 50 Ohm in the final product layout with one of the match configurations below. Depending on matching, NC will apply to certain components.

Package Handling and Storage Precautions

- The solderability of the external electrode may be deteriorated if packages are stored where they are exposed to high humidity. Package must be stored at 40 °C or less and 70% RH or less.
- The solderability of the external electrode may be deteriorated if packages are stored where they are exposed to dust of harmful gas (e.g. HCl, sulfurous gas of H₂S).
- Packaging material may be deformed if package are stored where they are exposed to heat of direct sunlight.
- Solderability specified in Para 9.4 shall be guaranteed for 6 months from the date of delivery on condition that they are stored at the environment specified in Para 1.1. For those parts, which passed more than 6 months shall be checked solder-ability before use.
